

Build Your Lead Capture Page

Pop-Up Pro with Kelsie Jimenez. Keep this. Everything you need is on these two pages.

START HERE

github.com/kelsieutah-ui/lead-page-starter

1 Get your Formspree address

1. Go to Formspree and sign in
2. Create a new form, name it **Lead Page**
3. Copy the endpoint. It looks like `https://formspree.io/f/abcd1234`
4. Leave that tab open, you need it in step 3

2 Make the page yours on GitHub

1. Open the starter link at the top of this page
2. Click the green **Use this template** button, then **Create a new repository**
3. Name it `lead-page`. Leave it Public. Click create
4. In your new repo click **Settings**, then **Pages** in the left sidebar
5. Source: **main** branch and **/ (root)** folder. Click **Save**

Saving Pages starts publishing your site in the background. It takes a minute or two, so do it now and keep going.

3 Have Claude build your page

1. Open Claude and start a new Project called **Lead Capture Page**
2. Paste the prompt below, filling in your own details

Build me a single HTML file for a lead capture page. One page, self contained, no separate CSS or JS files.

My info: _____, phone _____, email _____, brokerage
_____, license _____

Send the form to this Formspree endpoint: _____

Instead of making people type a lot, use buttons or dropdown choices for what they are looking for and their timeline.

My style: _____

Give me the complete file, ready to paste in.

Do not like how it looks? Just tell Claude. "Make it warmer." "Use navy and cream." "Rewrite this for first time buyers." Keep going until it feels like you.

4 Move it into GitHub

1. Copy everything Claude gave you
2. Back in your repo, click the file `index.html`
3. Click the **pencil** icon to edit
4. Click inside the code, select all of it, delete it
5. Paste yours in
6. Click the green **Commit changes** button, then confirm

Step 4 is where people slip. Make sure the old code is completely gone before you paste, and make sure you copied all of Claude's code including the very first and very last lines.

5 Look at your live page

Your address is:

`https://YOUR-USERNAME.github.io/lead-page`

If it does not load, give it another minute and refresh hard. If it still does not load, see the troubleshooting list on the back.

6 Test it before you share it

1. Fill out your own form and submit it
 2. Watch your email. If Formspree sends a confirmation, click it
 3. Submit one more time
 4. Confirm the lead actually lands in your inbox
- Do not put the link anywhere until you have seen a real test lead arrive.

7 Put it to work

- Instagram bio
- Email signature
- Texts to your sphere
- QR code on a sign or pop-by card

If something goes wrong

Page shows 404	Not enough time has passed, or the Pages setting did not save. Check Settings, Pages, source is main and root.
Page loads but looks broken or half empty	The paste was incomplete. Redo step 4 and make sure you copied all of Claude's code.
Form submits but no email arrives	Check for a Formspree confirmation email and click the link. Then submit again.
Form gives an error when you submit	Your Formspree address is wrong or missing. Search the file for <code>formspree.io</code> and check it matches your dashboard exactly.
You changed something and now it is worse	Nothing is ever lost. Ask Claude to put it back, or open the file history in GitHub.
Truly stuck	Text Kelsie. Send your page address and a screenshot of what you are seeing.

My Formspree endpoint: _____

My page address: _____

Tested and a real lead arrived: Yes Not yet
